

## Technical Update – Lite / Lock Conflict

Oshkosh Door Company's lite / lock calculator can be found at <http://www.oshkoshdoor.com/llcalc.htm>.

Lite / lock conflicts have been an age old topic of discussion when entering wood door orders. Architects and owners are typically looking for the largest lites codes and warranties allow.

Oshkosh Door Company has created an "on line" lite / lock calculator that has made identifying and fixing lite / lock conflicts easier than ever!

When you are detailing your Oshkosh Door Company door order, use the calculator to help you with any openings that have cutout only, wood or metal kits, double lites or louvers. Input your dimension data, choose your moulding type and click the "calculate" button.

You will be notified as to whether or not you have a lite / lock conflict.

If the calculator identifies a door type as having a lite / lock conflict we recommend that you address this with the architect during the shop drawing submittal process. This will help save time during the order entry process helping us secure the shipment date you need for your order.

If you have any questions, please do not hesitate to contact your inside sales representative.
